Introduction

Eight species of the genus *Phyllotreta* (flea beetles) feed on cruciferous/brassicaceous crops and weeds in the UK and they tend to be considered together. However they may have slightly different life-cycles and biology. Most of the information on their basic biology and ecology in the UK was collected many years ago and there do not appear to have been many recent studies, apart from those on methods of control, mainly with insecticides. The basic life-cycle of these species is described as follows:

- Adult beetles hibernate from October to March in hedgerows, under trees and in other sheltered locations.
- When temperatures rise in the spring the beetles come out of hibernation.
- They first stay close to hedgerows and feed on weeds, but they gradually disperse more widely and then when temperatures get to about 20°C more widespread dispersal occurs and they can fly with the prevailing wind.
- The older literature says that the period of greatest activity is from 10th April – 20th May – but more recently damage appears to have occurred over a much more extended period than this.
- The beetles mate and lay eggs towards the end of May.
- The larvae hatch and feed on plant roots and form pupae after about 4 weeks.
- The pupal stage lasts for about 4 weeks and then adults emerge in late July – early August when they again feed on crops.
- In autumn the beetles move into shelter, away from crops, and hibernate. The older literature suggests that the flea beetle population in any field is a drifting one and that different species dominate in different parts of the country.

Monitoring data 2020

No forecasts for flea beetles have been developed. However, they are recorded (all species together) from water trap captures in Warwickshire and these will be summarized during the year in the table below. Numbers of cabbage stem weevil, cabbage seed weevil and cabbage stem flea beetle are also shown. We first set up the traps in some overwintered swedes at Wellesbourne but the traps are now in allotments and a garden in Tysoe in Warwickshire.

Date	Total in 3 traps near overwintered swedes at Wellesbourne. Traps out all winter.				
	No. flea beetles	No. cabbage stem weevils	No. cabbage seed weevils	No. cabbage stem flea beetles	Number of traps
3rd March	0	0	0	0	3
10th March	0	1	0	0	3
17th March	0	1	0	0	3
